(54) Title: PDP CONTEXT ERROR HANDLING METHOD

(57) Abstract: Method and apparatus for dealing with a connection context request to establish a connection between a mobile station (MS) and a network gateway element. The gateway, (such as a GGSN) determines whether binding information is required, then ascertains whether such information has been supplied. If the information is not supplied, the GGSN responds to the request on the basis of a policy determined by the operator of the network. This can include, for example, rejecting the request.
